Mathematical models of many practical problems reduce to equations in which some terms are much smaller than others over most of the solution domain. Perturbation and asymptotic methods are formal approaches to simplifying the solution of such equation sets, often leading to approximate closed-form solutions.

Intended for graduates and advanced undergraduates, it assumes only a limited familiarity with differential equations and complex variables. The presentation begins with a review of differential and difference equations, then develops local asymptotic methods for such equations, and explains perturbation and summation theory before concluding with an exposition of global asymptotic methods.
