It affects parts of the bone marrow that form immune cells, red blood cells, and platelets. If someone has ... doctors will diagnose 5,150 men and 3,960 women with CML in 2021.

A review is given of the effects of external whole body and local irradiation in man and experimental animals. Internal irradiation by radioactive substances in man and experimental animals is considered. An abstract of pertinent findings is given in the summary and conclusions. All investigators are in agreement that blood formation occurs embryologically in an identical manner in all mammals. It consists of a condensation in the yolk sac of the embryonic connective tissue, the mesenchyme, into blood islands, the central cells of which 'round' up into basophilic cells which give rise to the primitive erythroblasts. These first basophilic cells have been called large lymphocytes by Maximow, hemocytoblasts by Bloom, Maximow, and by many other names. The blood cells produced in this embryonic site are largely so-called primitive red corpuscles which acquire hemoglobin, remain nucleated, and carry oxygen. As the embryo grows, primitive cells migrate to other sites and they, as well as local mesenchymal cells in these sites give rise to the definitive generation of red corpuscles, granulocytes, megakaryocytes, lymphocytes and other blood cells. The production of the cellular elements of the blood in places other than the yolk sac proceeds in a definite pattern, probably in the following order: liver, spleen, lymph nodes, and bone marrow. No division of function into production of myeloid and lymphatic cells occurs in any of these sites until late in embryonic life.

The Platelets: Physiology and Pharmacology is a critical review of the basic platelet systems, methodologic critiques, and platelet involvement in major disease states. This book is composed of 20 chapters that specifically deal with the physiology and biochemistry of the platelet system, along with possibilities for, and consequences of, pharmacologic manipulation. The opening chapters examine the basic processes of platelet aggregation and adhesion. These topics are followed by discussions on the types and functions of platelet <sup>2</sup>-granule proteins; the aspects of adenine nucleotide levels, regulation, and storage; and receptors for catecholamines and consequences of their agonism. Other chapters are devoted to the metabolism of arachidonic acid, its manipulation, consequences, and metabolite receptors. The discussion then shifts to the second-messenger entities, specifically calmodulin, calcium, and cyclic adenosine monophosphate. A chapter presents the comparisons of man and commonly used laboratory animals concerning platelet behavior variability. Another chapter looks into the use and appropriateness of the use of platelets as models of neurons, with a special emphasis on serotonergic neurons. The remaining chapters contain critical reviews of platelet involvement in diabetes, hypertension and peripheral vascular disease, atherogenesis/atherosclerosis, and ischemic heart disease. These chapters also include specific techniques for platelet analysis, including lumiaggregometry, eicosanoid measurements, and serotonin uptake and release. This book is an invaluable source for pharmacologists, biochemists, researchers, and clinicians who are interested in platelet involvement in disease.

Battle is a practical and sometimes lasting way of solving man's problems. It relies on the strength of the combatants and ignores the truth of the dispute. Discussion face to face can dissolve attitudes which have incorrectly determined judgements. The most striking example of this that I know is a Battle in Ireland in the eleventh century, where the king of Leinster fought a Viking prince. The Icelanders had raided Ireland for several generations in search of women, which they lacked since most of the population of Iceland were men who had arrived there by rowing long-boats from Norway. The prince was leading such a raid for the first time. Standing in the prow of the leading boat he saw Irish cavalry galloping along the beach to meet them. As they approached the shore the Irish king rode out of the band to challenge single combat. The Iclander jumped into the surf to meet him. As they raised their swords each realized that the other's face was like his own. When the Irish king spoke the other recognized the language. It had been spoken in Iceland by his grandmother who had been captured and taken there from Ireland. Swords were dropped and replaced by drinking horns. It was soon established that they were cousins. The battle gave way to a life-time of close co-operation.
