Development of solid propellant technology in India

High energy composite solid propellants were developed, characterized and produced at the Vikram Sarabhai Space Centre and at the Sriharikota Centre. Exotic fuel binders such as CHEF-20, Polyol and HTPB for these propellants were also developed in ISRO as part of the indigenisation programme. The Satellite Launch Vehicle-3 (SLV-3) conceived in the early seventies, was fitted with four stage motors filled with solid propellants made in ISRO's own plants.

Solid propellant rockets, using black powder as the propellant, were introduced by the Chinese in the early 13th century. The next significant event occurred in the late 17th and 18th centuries when the development of nitro-cellulose, nitro-glycerine, cordite, and dynamite resulted in their consideration as a rocket propellant.

SOLID ROCKET PROPELLANTS | Aircraft Technology

The development of solid propellants was accompanied by the development of insulation materials. From a strictly mechanical point of view, only the polybutadiene and cross-linked double base (XLDB) propellants can be used for case-bonded grains because of their good mechanical resistance during firing at low temperatures.

Technological advances in propulsion included the perfection of methods for casting solid-propellant charges, development of more energetic solid propellants, introduction of new structural and insulation materials in both liquid and solid systems, manufacturing methods for larger motors and engines, and improvements in peripheral hardware (e.g., pumps, valves, engine-cooling systems, and direction controls). By 1955 most missions called for some form of guidance, and larger rockets ...

Rocket - Development of rockets | Britannica

The solid propellant as a typical viscoelastic composite, consists of oxidizer particles, fuel particles, and polymeric binders. After experiencing the service conditions under complex stress states and temperature cycles, solid propellants would be damaged by the interface dissociation between polymeric binders and oxidizer particles, termed dewetting.

A solid-propellant rocket or solid rocket is a rocket with a rocket engine that uses solid propellants. The earliest rockets were solid-fuel rockets powered by gunpowder; they were used in warfare by the Chinese, Indians, Mongols and Persians, as early as the 13th century. All rockets used some form of solid or powdered propellant up until the 20th century, when liquid-propellant rockets offered more efficient and controllable alternatives. Solid rockets are still used today in military armament
