If there are existing containers for a service, and the service 's configuration or image was changed after the container 's creation, docker-compose up picks up the changes by stopping and recreating the containers (preserving mounted volumes).

docker-compose up | Docker Documentation

When working with Docker, software developers mostly use the 'docker run' command to:
Create a container from a given docker image
Run a container with an optional name
Run a container in the foreground
Run a container in the detached mode
Run a container in interactive mode
Publish container ports ...

The docker run command first creates a writeable container layer over the specified image, and then starts it using the specified command. That is, docker run is equivalent to the API /containers/create then /containers/(id)/start. A stopped container can be restarted with all its previous changes intact using docker start.

app using a Dockerfile and the services required for the app in a '.yaml' file.

~~How to Build and Run your apps using Docker Compose~~

Enter `http://localhost:5000/` in a browser to see the application running. If you 're using Docker natively on Linux, Docker Desktop for Mac, or Docker Desktop for Windows, then the web app should now be listening on port 5000 on your Docker daemon host. Point your web browser to `http://localhost:5000` to find the Hello World message. If this doesn ' t resolve, you can also try `http://127.0.0.1:5000`.

Docker Desktop. The preferred choice for millions of developers that are building containerized apps. Docker Desktop is a tool for MacOS and Windows machines for the building and sharing of containerized applications and microservices. Access Docker Desktop and follow the guided onboarding to build your first containerized application in minutes.

~~Empowering App Development for Developers | Docker~~

Docker Compose has an -f flag where you can pass in the location of the docker-compose.yml file (or a custom file if you happen to name it something different). That means you could run: `docker-compose -f /tmp/myproject/docker-compose.yml up -d` from anywhere on your file system and things will work. I use this a lot in my scripts.
