Examples Of Geometric Problems With Solution

Geometry Word Problems

Involving Area. Example 1: A rectangle is 4 times as long as it is wide. If the length is increased by 4 inches and the width is decreased by 1 inch, the area will be 60 square inches. What were the dimensions of the original rectangle? Solution: Step 1: Assign variables: Let x = original width of rectangle. Sketch the figure

Geometry Word Problems (video lessons, examples and solutions)

Geometry Math Problem involving the perimeter of a rectangle The following two videos give the perimeter of a rectangle, a relationship between the length and width of the rectangle, and use that information to find the exact

value of the length and width.
Example: A rectangular garden is 2.5 times as long as it is wide. It has a perimeter of 168 ft.

Geometry Math Problems

(solutions, examples, videos, examples)

Example – 5: In a G.P first term is ' 1 ' and 4th term is ' 27 ' then find the common ration of the same.

Solution: Here $a = 1$ and $a_4 = 27$ and let common ratio is ' r ' . So.
 $a_4 = a r^{4-1}$. $27 = 1 r^{4-1} = r^3$.

Common ratio = $r = 3$. Example
– 6: Find ' a ' so that a, a+2, a+6 are consecutive terms of a geometric progression.

Given that the probability of successful optical alignment in the assembly of an optical data storage product is $p = 0.8$. The trials are independent. Thus random variable X follows a geometric distribution with probability mass function. $P (X = x) = p (1 - p) x - 1 ; x = 1, 2, \dots$
 $= 0.8 (1 - 0.8) x - 1$
 $x = 1, 2, \dots$
 $= 0.8 (0.2) x - 1$
 $x = 1, 2, \dots$
. a.

Diophantine problems have fewer equations than unknowns and involve finding integers that solve simultaneously all equations. As such systems of equations define algebraic curves, algebraic surfaces, or, more generally, algebraic sets, their study is a part of algebraic geometry that is called Diophantine geometry.
