---

Codominance and incomplete dominance? - Answers  
Closely related to incomplete dominance is codominance, in which both alleles are simultaneously expressed in the heterozygote. We can see an example of codominance in the MN blood groups of humans (less famous than the ABO blood groups, but still important!). A person's MN blood type is determined by

---

Incomplete dominance,  
codominance & multiple  
alleles ...

Incomplete dominance and  
codominance are two types of  
genetic inheritance, and  
while both are variants on  
the standard  
dominant/recessive traits,  
it's important to know the  
difference between  
incomplete dominance and  
codominance. Incomplete  
dominance is when the  
phenotypes of the two  
parents blend together to  
create a new phenotype for  
their offspring.

the alleles present on a

gene are expressed in the phenotype. A flower showing codominance will have patches of red and white instead of a uniformly pink flower.

---

Incomplete Dominance -  
Concept of Dominance And Co  
dominance

In incomplete dominance, the F<sub>2</sub> generation from heterozygous plants will have a ratio of 1:2:1 with the phenotypes red, white and spotted flowers. The humans with AB blood type also show codominance where the alleles for both blood types A and B are expressed.
