This book investigates the impact of both real and financial integration to growth and to welfare, and to enquire whether increases in either or both forms build the linkage between the real and financial economy. It contributes to the following two areas: (1) Research of economic developments in East Asia, the most dynamic and populous region in the world, in itself is important for researchers, policy makers, journalists, business people and others. East Asia's economic developments influence peoples' lives not only in East Asia but also in other parts of the world. (2) Many aspects of East Asian experiences in economic development are unique, making research of East Asia attractive and important to discern mechanisms of economic development. The first part of this study begins with chapters that address the measurement of regional integration compared with the engagement with the global economy and how this influences the aggregate behavior of the economies. The second part turns to consideration of the financial sector and the efficiency and performance of banking in the region. This allows a discussion whether, in the current crisis, the banking sector was an important channel of financial shock into real behavior. The third part turns to the corporate sector. Using data on firms, type of finance used by firms, its impact on their performance, and ownership structure influence over the productivity growth are discussed. Based on the findings, the book presents several policy recommendation and future research agenda for further economic integration in East Asia.

The tremendous success of China's program of economic reform and the rapid integration of China into the global economy have prompted this study on the economic and financial integration between mainland China, Hong Kong, and Taiwan — a grouping sometimes referred to as Greater China. While there has been a plethora of analyses of China's economic interactions with other economies, this book fills the need for a thorough investigation of regional financial and real interactions — corresponding to the many exhaustive studies of such interactions between developed countries and between East Asian countries. Since real and financial integration has substantial implications for the efficiency of resource allocation and the efficacy of macroeconomics policy, Cheung, Chinn and Fujii offer clear analysis of the current state of economic integration of Greater China, thereby helping to gauge the potential role of China in the global economy. Prospects of a currency union in Greater China, an extreme form of integration, are also evaluated with respect to benefits and costs to the three parties. In addition, the authors provide complementary discussions regarding the degree of integration between China and several Pacific Rim economies, including those of Japan, Korea, Singapore, and the United States. Cheung, Chinn and Fujii provide an up-to-date assessment of mainland China's economic development and its integration with its neighboring economies, especially Hong Kong and Taiwan. This grouping is also known as Greater China. There are a number of approaches to assessing economic integration, and the authors present some standard measures — including trade flows, output movements, saving and investment correlations, and consumption comovements. They emphasize the measures based on some key parity conditions in international finance — real interest parity, uncovered interest parity, and relative purchasing power parity. While there is no perfect empirical measure of economic integration, the theoretical relationships between integration and these three parity conditions are well founded in economics. Moreover, the three parity conditions constitute a unified framework that can be used to assess the degree of real and financial integration, and thus offer a convenient way to investigate the interaction between these two types of integration. In addition, the authors evaluate the prospect of a currency union in Greater China, the most extreme form of integration. Prospects of China's continued integration with the world economy, and the implications of policies in Beijing and other Pacific Rim capitals are also discussed.

This Working Paper brings together three papers prepared as background for discussions at the Second High-Level Conference on Asian Integration cohosted by the Monetary Authority of Singapore and the IMF on May 25, 2006. The first documents recent trends in the intraregional flow of goods and capital and explores linkages between real and financial integration. The second focuses on the institutional and regulatory reforms needed to reap the benefits-and contain the risks-of financial integration in Asia. The third considers the implications of economic integration for the choice of the exchange rate regime and the conduct of macroeconomic policies

Globalisation, financial deregulation, a single European currency - what do all of these changes mean for the world economy?

Financial Integration in East Asia, first published in 1999, examines the degree of domestic and financial openness in ten Asian countries (Japan, Australia, Hong Kong, Indonesia, South Korea, Malaysia, the Philippines, Singapore, Taiwan and Thailand) and the effect financial openness has on the structure of the macroeconomy. After examining the reasons behind the 1997/98 financial crisis, Dr de Brouwer puts these in context by summarising the literature on the costs and benefits of financial reform. He then assesses the information that interest rate parity conditions have for financial openness, and sets out theoretical and empirical models to explore the link between market interest rates and intermediated interest rates on deposits and loans. Financial Integration in East Asia also contains reviews of the literature and regional developments, with clear policy analysis throughout.

This paper assesses changes in synchronization of real activity and financial market integration in Western Europe and evaluates their implications for financial stability. We find increased synchronization of real activity since the early 1980s and increased equity markets integration since the early 1990s. We also find that measures of systemic risk at large European financial institutions have not declined during the period 1990-2004 and that bank systemic risk profiles have converged. At the same time, the sensitivity of bank and insurance systemic risk measures to common real and financial shocks has increased in most countries. Overall, these results suggest that the integration process does not necessarily entail an unambiguously positive effect on financial stability.

The establishment of the ASEAN Economic Community (AEC) at end-2015 has brought into sharp focus the issue of financial and economic integration in the region. This paper takes stock of ASEAN's financial integration and prospects. ASEAN integration could accelerate in the years ahead; it will likely be a safe, gradual process consistent with the "ASEAN way" of consensus decision-making. Properly phased and sequenced, closer financial integration has the potential to help increase real incomes and accelerate real convergence within ASEAN and narrow the region's gap with advanced Asia. Realizing the promise of financial integration will require ASEAN countries to make long-term investments in financial infrastructure. Policymakers can draw on the experience of their more advanced peers and of other regions. Gradualism and safeguards should not be excuses for inaction or financial protectionism. Reliance on flexible policy frameworks and a strengthened and tested regional financial safety net should be part of the agenda. Closer engagement with the Fund could also help.
